

ABSTRACT

An IC card is provided into which information can be written without requiring a writer.

The IC card (1) includes an IC chip (3), an antenna (4), and a plurality of circuits (5), which are built into a card main body (2), terminals (6, 7) connected to the extremity of each of the circuits (5), and a conductive sticker (8) affixed to the surface of the card main body (2) and providing continuity between the terminals (6, 7). Among a plurality of the conductive stickers (8), by peeling off a particular conductive sticker (8), continuity of the circuit (5) corresponding to the peeled conductive sticker (8) is broken, and since the IC chip (3) transmits a signal corresponding to the continuity/discontinuity states of the plurality of circuits (5) to a reader, information can be written without requiring a special writer by simply peeling off the conductive sticker (8), thus greatly improving the convenience.
